Detect your targets day or night with the PARD Leopard thermal monocular, combining precision, lightness and cutting-edge technology.

The PARD Leopard is a compact and powerful thermal monocular, ideal for observation in low light conditions or in total darkness. Thanks to its high-resolution sensor and digital zoom, it offers a clear and detailed image, perfect for hunting, surveillance or outdoor activities. The LRF models have an integrated laser rangefinder.

The PARD Leopard thermal monocular is designed for demanding users looking for a lightweight, high-performance and versatile device. Equipped with a high-definition thermal sensor, it detects heat sources at long distances, even in the most difficult environments, such as dense fog or moonless nights.

With its integrated OLED screen, the Leopard displays sharp, high-contrast images, allowing for quick target identification. Its digital zoom allows for precise observation of distant details, making this tool ideal for hunting, scouting or surveillance.

Leopard also offers multiple thermal color palettes, suitable for different scenarios: hot white, hot black, red or fusion mode, for optimal adaptation to the user's specific needs.

Its compact and ergonomic design ensures a comfortable grip, even for extended observation sessions. Powered by a rechargeable battery, it offers extended autonomy, ideal for field trips.

Resistant to shocks, weather and extreme temperatures, the PARD Leopard is built to last, whatever the conditions. Compatible with tripods for increased stability, it also incorporates modern features such as video recording or real-time transmission via Wi-Fi (depending on the model).
